

User Manual

Tool Overview

This command-line tool automates the process of generating bug classification metrics across multiple software engineering datasets.

Usage Instructions

Step 1: Dataset Placement

Ensure that the 'Datasets' folder containing the 5 CSV files (caffe.csv, incubator-mxnet.csv, keras.csv, pytorch.csv, tensorflow.csv) is located in the parent directory (relative path '../Datasets/').

Step 2: Execution

Open your terminal, navigate to the `bug\_classifier` directory, and execute the evaluation script:

```
python evaluate.py
```

Step 3: Monitoring

The script will output progress information as it performs 30 repeated runs of a 70/30 train-test split for each dataset.

Step 4: Output

Upon completion, it will display a comprehensive performance metrics table. These results will also be saved automatically to `evaluation\_results.csv`.
